

Platinum class

Platinum class have been very busy this month. We have been investigating capacity and volume using a range of different materials. We have used different equipment to measure items and different ways of recording the information we have gathered including estimating. We used rice, water, sand and oats. We estimated the number of spoons of rice it would take to fill a vessel and then tested our predications. Some of us measured water in litres, predicting how many litres would fill the container. We had lots of fun experimenting with the different materials and equipment.
