

Yellow Class

This term and last term, yellow class is working on the concept of the properties and changes of material.

The students are learning about the gaseous, liquid and solid state through experiments and games.

To learn about the solid and liquid state we have done an experiment with ice.

To learn about the gaseous state, we have done an experiment with a balloon and a bottle in which mixing baking soda with vinegar produces a gaseous reaction which inflates the balloon.

We also played several games in which the students had to identify the liquid, solid and gaseous states.
